

# High performance fabric belts for the wood industry

## INDUSTRY

Wood

## PRODUCT

Elastomer/rubber belts

## PROCESS

Wood slow-down boards  
for planing machine

### Situation

Wood planing machine (planer) is commonly used in woodworking shops to prepare lumber for further processing or to achieve precise dimensions for woodworking projects. The wood is fed into the planer, and the cutter head removes thin layers of wood from the surface, resulting in a smoother and more uniform thickness across the board.

Customers frequently encounter issues related to belt wear, leading to a loss of essential traction required to effectively **decelerate wood boards** before the planing machine.

### Solution

**Slow-down high performance rubber belts from Ammeraal Beltech are ideal solution.**

Thanks to extraordinary wear-resistance rubber compound, wood boards transport is precise and the lifetime of the belt itself is 5 times longer when compared to conventional belts.

- 560131 Nitrile BX/EF 13/2 00+C37X (PVC) blue

### Benefit & Advantages

- **Excellent wear-resistance**
- **Longer lifetime**
- Increased productivity
